
Particle-based simulation using spheropolygons

Fernando Alonso-Marroquin and Syed Imran
ESSCC, The University of Queensland, Australia

Snapshots produced from a particle-based simulation using spheropolygons [1]. These geometrical objects are generated by sweeping a sphere into a polygon. This method is used to generate very complex shapes, including non-convex bodies, without the need to decompose them into simple spherical or convex parts. Dynamic simulations are performed using a conservative elastic interaction between spheropolygons.
